Developing a basic poisson distribution model

Step One - Gathering Data

You'll need base

numbers for each team in the league that reflect their attacking and defensive strength. The nice thing about basic poisson distribution is you can do it by hand, spreadsheet or just in a table on Word. The choice is yours. But you will need to update the numbers each week, so knowledge of a spreadsheet would make the process easier and more efficient.

Your base numbers will be the numbers of goals every team

has scored and conceded during your sample size. It may be 20, 30, 50 games, or just the season so far. Sample size is important but it depends on your personal opinion and time constraints.

Step Two - Starting Your Model

Here's what we do with our base

numbers. We know how many goals each team has scored and conceded so far this season. Make sure you also have the breakdown of goals scored at home and goals scored away.

We

want to work out the average number of goals scored at home and away. So, take the total number of goals scored home/away and divide each by the number of goals played. Let's use the Football League as an example, where 46 games are played.

The team in

focus scored 49 goals at home and 36 away. Below are the example equations of what we must do with each team's goal output to find their home and away average.

Goals scored

at home (49) / Games played at home (23) = Average Home Goals (2.13)

Goals scored away

(36) / Games played away (23) = Average away goals (1.56)

Step Three - Expanding Your

Dataset

Our team averaged 2.13 goals per game at home and 1.56 goals per game away from home. Offensively, we'd say that's a pretty good output. But that's not of much use if we fail to recognise they could be conceding a lot or keeping clean sheets regularly. We also need to know their defensive capabilities.

The same theory applies with identifying defensive averages. We want to know how many goals a team has allowed home or away. Our team has allowed 23 goals at home and just 17 away from home.

Goals

allowed at home (23) / Games played at home (23) = Average Home Goals (1.00)

Goals

allowed away (17) / Games played away (23) = Average away goals (0.73)

Step Four -

Including Averages

Before you move on to calculating the expected goals output or looking at individual games, it's a good idea to understand where each team ranks in relation to league averages. League averages can be found by adding averages of each team together and dividing by the number of teams in the league. That will be your focal point with teams ranking either above or below the league average.

Step Five -

Maths and Formulas

Now we've come as far as predicting a goals output for two teams in a game. Our example team, Team A, are hosting Team B. We need to know how Team A perform at home and how Team B perform away from home.

To work out the attacking

strength of a team, we start with our average goals at home. Team A scored an average of 2.13 goals per game at home. We then divide this number by the average number of goals scored by all home teams that season (remember the focal point we mentioned?)

Let's say the average is 1.55.

Team A's Goals per home game (2.13) / League average home goals (1.55) = 1.37

Team A's attacking strength is 1.37

We also want to know how

strong Team B is defensively. We will be using example numbers here for Team B, but we've already demonstrated above how to determine a team's goals output or goals against ratio for home and away games above.

Our Team B has averaged 1.10 goals away from home, whilst the league average is 1.61.

Team B's Goals against per away game (1.10) / Average away goals allowed (1.61) = 0.68

Team B's defensive strength is 0.68

You might expect you'd need a higher number to reflect strength, but you'll see in the next sum why that 0.68 number is very useful to identifying their defensive strength. The following formula allows you to calculate the home team, Team A, expected goal output for this game.

Team A attack strength (Home) x Team B defence strength

(Away) x Home goals average

$1.37 \times 0.68 \times 1.55 = 1.44$

The home side are expected to score 1.44 goals on average.

We would then apply the same process to the away side to determine their attacking strength. Using the same method as above, we discover that the away side, Team B, have averaged 0.98 goals per away game. We also work out the

home side's defensive strength is 0.75. The league average of away goals is 1.18.

0.98

$0.75 \times 1.18 = 0.86$

The away side are expected to score 0.86 goals on average.

The

predicted outcome we have is Team A 1.44, Team B 0.86. That shows us that Team A are almost nailed on to score a goal in nearly every game, Team B could fail to score often, and there is a predicted 0.58 goals between the team.

One of the issues with

some of the data the method puts out is that it is nothing more than averages. Averages aren't necessarily what will occur every game, as several lopsided scores could balance out several low scoring games. So how do we deal with that?

Step Six - Correct Score

Probabilities

You can use the data you get to predict the likelihood of the most probable correct scores. You can do this yourself, but it's already a long enough process. Using a simple online calculator will give you the probability for each correct score.

The data you need to input is the number of outcomes you are considering (let's say we are working up to four goals) and the expected event occurrences, which is the team's attacking strength.

Goals 0 1 2 3 4 Team A 23.69% 34.81% 23.84% 10.88%

3.70% Team B 42.31% 36.39% 15.64% 4.48% 0.009%

Each number is a separate value, so by

taking the most probable goal output for each teams, you can pick out the two standout most likely scores as...

Team A 1 (34.81%) - Team B 0 (42.31%)

Team A 1 (34.81%) - Team

B 1 (36.39%)

Step Seven - Find the exact probability

That highlights the most likely

correct scores, but it fails to show you the exact probability of them. By multiplying the two percentages together (expressed as decimals) you can find the exact probability if that correct score.

For 1-0, it's 34.81% vs 42.31%. As a decimal sum, that's 0.3481

$0.3481 \times 0.4231 = 0.1472$. You convert any decimal to a percentage simply by shifting the decimal point two places to the right, so 0.1472 is 14.72%. The same method is used to determine the likelihood of a 1-1 draw, which is 12.66%.

Ativista Antifascista Italiana Presa na Hungria aceita Candidatura à Eleição Europeia

Ilaria Salis, uma ativista e professora de 39 anos de Monza, perto de Milão, está qbet prisão na Hungria desde fevereiro de 2024. Ela foi detida após uma contramanifestação contra um rally neonazista e acusada de estar ligada a uma organização de extrema esquerda.

Sua prisão causou protestos diplomáticos e indignação na Itália. Ela relatou condições alarmantes de detenção, incluindo células infestadas de ratos e baratas, falta de cuidados médicos urgentes e prisão ilegal.

Após qbet indicação às eleições europeias de junho, as autoridades húngaras deverão decidir sobre a concessão de imunidade a Salis. Sua advogada, Gyorgy Magyar, afirmou que a imunidade passaria a vigorar após a apresentação da lista de candidatos. No entanto, ainda há incertezas quanto às consequências da candidatura sobre o seu caso judicial.

Itália Protesta contra o Tratamento de Ilaria Salis

O governo italiano descreveu o trato dado a Salis como "humilhante" e solicitou a qbet libertação imediata. O ministro das Relações Exteriores, Antonio Tajani, disse que o tratamento de Salis "ultrapassou os limites".

Data	Evento
-------------	---------------

Fevereiro de 2024	Ilaria Salis é detida qbet Budapeste após uma contramanifestação.
-------------------	---

Março de 2024	O governo italiano protesta contra o tratamento de Salis.
---------------	---

Abril de 2024	Salis é indicada às eleições europeias de junho.
---------------	--

Impacto da Candidatura nas Eleições Europeias

Apesar da indicação, o impacto na qbet situação judicial é incerto, pois ela provavelmente terá de aguardar o resultado das eleições e a decisão das autoridades húngaras sobre a imunidade. No passado, o Parlamento Europeu retirou a imunidade de três deputados fugitivos da Espanha.
